Ripper opens can of worms

Chambers - not concerned

A STORM of protest has erupted following the release of CRL's Jack The Ripper computer game. The game, which features pictures of jutally mutilated women, has re-

cently received an '18' certificate from the British Board Of Film Classification. Conservative MP Harry Green-

conservative Mr Harry Greenway has lashed out at CRL and said, "This game should immediately be confiscated by the police". Greenway was both appalled and sickened when informed that

one scene in the game shows a picture of a near-naked woman lying dead in a pool of blood. Clement Chambers, 23 year old chairman of CRL, said "Poople are

chairman of CRL, said "People are used to horror and are interested in it. Acck The Ripper is something that by having explicit details in it adds a whole new dimension" he continued. By receiving an "18" certificate,

Jack The Ripper is subject to certain laws as who it can be sold to.

Chambers isn't too concerned that under 18's may see the game, however. "I'm not particularly worried. If you think I stay up all night worrying about it, then no. Dealers know they can't sell to persons under IB as there is a sticker saying this on the packaging" he said.

Apparently the only warning dealers have about the nature of the game is on the packaging. Electronic Arts, CRL's distributors, didn't realise the game was of a strong nature.

John Porrest, a Director of EA said: "We knew it would be certified, but I thought it was in the same genre as other releases, so we have not really informed dealers in any major way."

According to a spokesman for The Home Office; "any dealer seliing the product to under 18's could face legal action and face a fine up to \$2,000". If the product is sold by mail order, then a declaration would stating that they are 18 in over. Would any police action be taken? "We're not aware of the computer game and cannot comment", a spokesperson for Scotland Yard

Ken Penry, Deputy Director of The British Board III Film Classification said the game received an '18' certificate for two reasons. "There is one particular graphic picture of a woman and also there is a passage in the dialogue which meant the game had to receive an '28' certificate."

Chris Paradine, research assistant for Jo Richardson, the Labour Party Spokesperson on women, said "I would call this pornograph-

"This is part of a complex syndrome of trivialising and degrading women and perpetuating sexist stereotypes."

grading women and perpetuating sexist stereotypes." Chambers himself said, "This

THIS WEEK the final element of the Data Protection Act came into force, giving you the right to see personal data that is held on computer files.

The storing of personal information on computers has always had a 'Big Brother Is Watching You' menace about it.

Among those who receive confidential data are banks' employers and schools, and if the information they have is inaccurate, the subject's life could be seriously affected.

Sarah Spencer, General Secretary for the National Council of Civil Liberties (NCCL) gave a case example. "A former employee of an international oil company was blacklisted because they thought he was a communist. Although he continued on gase 6 b

The mystery surrounding the Virus Amiga program looks like being a and re-run of Commoder's "Crisis" What can be a surface of the commoder's "Crisis" with the summer. Then, as and re-run of Commoder's a "Crisis" attitude to the Afoly grey imports affair during the summer. Then, as now, a situation arrow which was affecting large numbers of Amiga owners who had paid good money—for large numbers of Amiga owners who had paid good money—for the run of the commoders and the commoders which the commoders will be a summer to the commoders of the commoders of the public And then, as now, Commoders surveyed the situation from a position of migastic inactivity. This is no tog of enough.

from a position of majestic inactivity. This is not good enough. The pages of this magazine have been littered all too often in the past with stories of firms not keeping faith with their customers. All too often the simple truth has had to be restated computers are not cheap, and customers have a right to

expect much greater support from manufacturers in situations such as this.

such as this.

Of course it may be that, as a Commodore spokesman suggested, that someone is pulling our collective leg, in which case you can expect three lines at the bottom of an inside page in next week's issue by way of grovelling apology.

But what if we are right and Commodore is wrong? Commodore will then be in the unenvisible position of not only falling to respond quickly enough to a serious situation, but compounding that failure by doministing it as a hoax. We are confident that our readers will be the arbiters in this case, as in many others and that they will prove the truth or otherwise of many others and that they will prove the truth or otherwise of the position of the commodore to rectify matters.

ere we go again. CRL s. Acet. The Ripper has got all the blag gusteds from Tunbridge Wells and beyond craviling out of the woodwork. Once again, a software house has won masses of cheap, if not free, publishing by using the oldest trick in the book – shook horror. Once again the press – Popular Computing Weekly in on exception—has played along and again the ferminist lobby has found itself in bed, so to speak, with the hang the mand forg 'em brigger.

There are two ways for the public and the computer industry to eradicate shoxploitation. One is obviously for the public not to buy it and its purchase other titles instead. In the case of games which are in any case good to play, that is maybe

to the companies of the rest of the computer software lower to the computer software lower to the computer of the computer when it so difficult about dreaming up other ways of promoting them, so that software houses won't be tempted to appeal to the lowest common denominator 'This kind of thing, is let's late it, more threaten and boving than actually shocking, if the purveyors of the computer o

Amiga plague mystery

MYSTERY last week surrounded a program which is corrupting discs and data held by increasing numbers of Amiga users.

numbers of Amiga users.
According to Yuri Large, of the
Amiga User's Chub, the Virus program was initiated by the Scandinavian Cracking Association (SCA)
to outlo all the other cracking

groups.

SCA created Virus by producing a program which writes itself onto the RAM and then infects every disc which subsequently comes into contact with it. Having put the program on all the games it had creacked, the SCA then passed them to its contacts and so Virus

spread.

But Commodore appeared not to
be taking the matter seriously.

Amanda Cridge, marketing manager for Commodore U.K., dismissed Virus as a hoax saying,

"It's like something out of a

science fiction boom"

Large is adamant that it does exist. "It is quite a big thing, We've had a batch of software and dwn and it's been on the machines in our shops. Now we won't let anyone we don't know put their discs into our machines."

In addition, Alan Hubbard of Dimension Computers, Leicester, informed us that Virus had suddenly appeared on his machines. He had no idea what had caused it.

"I'm completely in the dark about it," he said. "There was suddenly a message on the screen

snying, 'Your Amiga is Alive'."
At the moment, Large thinks it in predominantly Amiga pirates who are contracting Virus, retribution for their illicit dealings, one

might say.

Sooner or later, legitimate users will be on the receiving end, unless the infection can be erafficated.

Despite the mystery surround-

ing Virus, Large explained that it was very easy to get rid of. "Turn off the machine for a minute to allow the memory to clear and then use a Virus killer on each of your dises." Virus killer was devised by hackers in the U.S. but available in Britain for \$2.50.

While Large maintains that almost every Amiga user has heard about or seen Virus, Commodore remains unconcerned. Another Commodore U.K.

remains unconcerned.

Another Commodore U.K.
spokesman stated that Virus was a
little too similar to the AIDS epidemic to be taken seriously. He
added, "I think someone is pulling
your leg".

Whenever you switch on an Amiga you need to insert a boot disc which contains basic information about the initial set-up serven colours, stack space and

The cute computer show

By Peter Worlock

WHILE the rest of the world is preoccupied with the burning issues of the day - where is OS/2? is the Ansiga better than the ST? should I buy an Amstrad PC or someone else's!, Macintoh owners quietly continue their love affair with the cute computer and Apple continues Be rake in the millions.

To say that Apple is doing things its own way is a massive understatement and nowhere was this more evident than at last week's MacUser Show at North London's Business Design Centre.

The Business Design Centre and the Mac might have been made for each other, sharing that "very designer" appearance. Not for the Mac the soulless caverns of Olympia, nor the every day feel of some anonymous city hotel.

annaymous exty notes. Once you had gained entrance in this hallowed ground, the first impression was bewildering to any hardened show-goer. For one thing there was near sellence - no throbbing soundtracks booming from normality stands, for another there were not bronging masses barging down crowded askes. Instead there was near through the property of the property

ised by the marketing department. But there was new product, and a lot of it. Some was newer than others: Ashton-Tate was showing

dBase Mac, a full year after its debut (a sort of Star Trak of the business world), but the company insists that the software is ready this time. It is more or less exactly what you'd expect: all the features of dBase on the PC, coupled with the Mac's windows, menus and mouse-driven control.

There was a second new contender in Mac databases in the form of 4th Dimension, distributed in the UK by User Power Software. Preliminary reports are good, but

at 5645 it would have to be good. Measwhile, Blyth Software, flying the flag for Britain, was pilling the crowds (using "crowd" in its loosest sense). Its Omnis 3 program has established a virtual monopoly in the area of serious data management on the Mac and Ashton-Tate may have taken 12 months to so long in brinding dBase

to the Mac market.

Not surprisingly, desktop publishing products abounded with laser printers, scanners and big screens coming at you from all sides. DTP software continues to lie a cut-throat need for superancy. Quark Kpress, a highly praised mewormer, drew a bit of attention, while market-leader Addus announced Regumeker version 3. This is Addus' response is Ready-Setflo version 4, but senesking up on the billed side, Letraset announced Regument Setflows and the set of the s

Apple itself brought two new products to the show Multifinder and Hypercard. The first is a new Mac operating system which offers limited multitasking but is claimed to be compatible with existing

software. Hypercard defice de-

The Macintosh Plus - improved speed,

scription and is really a new category of software part operating system, part programming language for people who can't program, part freeform database, part graphics paint program, part Sidekick lookalike, and some of just about everything else you can think of.

One noted Macintosh observer has said Hypercard will be recognised as a milestone in the history of computing. I can't help feeling it's much more important than that, but you'll have to see it for yourself.

One for the Dear Santa Depart-

ment: take a Mac II, add Supermac's Spectrum graphics board and its 19-inch colour monitor and you've got a commercial graphics workstation. The system gives you a 68/20 processor, megabytes of RAM. 1024 × 768 pixel resolution, and 256 colours from a pallette of millions. Not much change from \$10,000 though

On a more accessible scale, there was a Mac version of BBC Basic, Borland showed the latest versions of Sidekick and Turbo Pascal, and like Canute trying to hold back the tide, HSV Computer Services fought for that old computer show feel by flogging discount discs, printer ribbens and

By any standards the MacUser Show has to rank as a success, not least in the sense that it demonstrated the Mac's victory – against all the odds – in establishing itself as a serious rival to the IBM PC standard.

boxes of paper.

But I couldn't escape the feeling that in achieving that success, Apple has lost something along the way - a sense of fun, perhaps, or the spirit of adventure. These may not be valuable commercial assets, but I've always thought they were the computer industry at its best.

Pirate launch

THIS WEEK budget company, Pirate Software, launched their first Spectrum +3 compilation.

The new label is called Pirate 3+3 and is priced at \$9.95. Leigh Richards, Pirate Publishing Manager, explained, "Instead of paying for games on separate discs, we are offering the consumer the chance to buy three on one."

The first titles available on Pirate 3+8 are Call Me Psycho, Holiday in Sumaria and Smash Out, all of which were previously available for the Spectram 48/128K.

19-25 NOVEMBER 1987 POPULAR COMPUTING WEEKLY/9

The Data Protection Actwill it protect?

Francis Botto outlines the new Data Protection Act and analyses the effect, if any, it will have on accessing and protecting personal information.

On November 11, Eric Howe the Data Protection Registrar truly became the Data Protection Registrar, with powers to prosecute offenders in the criminal courts, and initiate searches of premises If suspicions arise. But just how effective is the Act going to be; will it be a 'white elephant. Act' being impossible to enforce?

The Data Protection saga began in July 1984, with the very purpose of eventually governing the conduct and manner of computer bureaus, individuals or establishments utilising computers to store personal information. In other words, the Act is an attempt to keen tabs on data users. As expected, a logical starting point was to catalogue all data users by requesting them to apply for registration. In the brief registration period - November 1985 to May 1 1986 - little more than half of Britain's data users registered. Though this may sound totally discouraging or perhaps disgraceful, we are assured by the Data Protection office that this is in keeping with similar ventures implemented by our European counterparts. According to the Act, data users failing to register are technically offenders, who may subsequently be fined up to \$2,000 in the lower courts with unlimited fines in the higher

Principles

In theory, the Act is quintessentially concerned with protecting the rights of individuals like you and me by attengting to ensure all collected data is accurate, solely relevant, legitimately enquired, divided for a particular purpose and perhaps most important the Act seeks to impart personal information with subjects concerned — a right we are presently deprived. Eric flowe has drafted eight easily understood principles that set the Act's purpose in motion.

- The information to be contained in personal data shall be obtained, and personal data shall be processed, fairly and lawfully.
- Personal data shall be held only for specified and lawful purposes.
- Personal data held for any purpose or purposes shall not be used or disclosed in any manner incompatible with that purpose or those purposes.
- Personal data held for any purpose or purposes shall be adequate, relevant and not excessive in relation in that purpose or those purposes.
- Personal data shall be accurate and, where necessary, kept up-to-date.
- Personal data held for any purpose or purposes shall not be kept for longer than is necessary for that purpose or those purposes.
- An individual shall be entitled:

 at reasonable intervals and without undue delay or expense;
- to be informed by any Data User whether he holds data of which the individual is a subject; and ○ to access to any such data held by a

Data User, and,

O where appropriate, to have such data corrected or erased.

 Appropriate security measures shall be taken against unauthorised access to, or alteration, disclosure or destruction of, personal data and accidental loss or destruction of personal data.

Arguably, though most of the principles can be comfortably put into practice, the seventh principle seems to be the one

which threatens the Act's over-all effectiveness. For example, if a subject feels data user possesses inaccurate personal data or is illegally vending information, unless the subject knows of the data user.

the subject is helpless, as is the case now.
Also after November 11, data concerning
an author data of the subject of the subj

Of course I'm not suggesting the Act will be useless, but merely highlighting the problem of pinpointing the not so scrupulous data users. For, many individuals now falling victim in such data users will no doubt continue to do so.

Who should register?

In many respects the Act is sensibly almed, so not everyone who uses their home computer to store personal information need register. Here are some examples: if you store information about members of your family for other than professional purposes.

Personal information relating to members of your computer club or whatever can gain you exemption providing the eight Principles are observed and each and every member of your club approves of his or her personal data being stored.

Certain payroll and accounting operations are also exempt.

If you are not sure whether or not you, should register, it is perhaps advisable to contact the Registrat's office for further information, which will be issued to you free of charge. And if ambiguity should occur, and we are informed that it will, then it is perhaps safer to pay the \$22 set of your contact of the property of the pr

Professional data users of any kind are most likely obliged to register even if they are data users in a third party sense,

NEWS ANALYSIS

. Etic Howe, with prophotic equipment used for mexing the Data Protection Registry.

where perhaps their accountant handles personal data - you don't even have to own a computer to he m data user. Once again, if in doubt contact the Registrar's office.

The register

As would be expected the register is open to scrutiny by the public with engine of the register and Index already available in many of fictains man inharries. The register besides containing data users and registration numbers, also conveys the type of data stored and the use to which it is put, and to whom the information is put, and to whom the information is related to the case of the data of the

However, here is the 'sting in the Act's tail'. data users are to be eventually permitted to charge for this service - the price of which will be decided by the Home

You could be forgiven for thinking that the seventh principle infers there will be no charge - in fact it merely implies this notion. But just how contradictory principle 7 is will largely depend on the forth-

coming cost of the service. The outcome

The outcome of the Act in terms of ability metame the likes of ruthless data users will largely depend on the effectiveness of complementary detective work in sifting

out offenders. And as for this new openness the Act seeks to achieve, that will largely depend upon the cost of obtaining such information - which will make or break the Act.

in short we shall just have to wait and see, but I for one am scentical.

For further information contacts

Now the good news

note with dismay the absence of any reference whatever m the puzzle in your issue dated 10-13 November Obviently you have not been able to agree a fee with Gordon Lee and you have not been able to all any of your readers to do w cheaner if the mizzle is pleased out. I shall certainly not bother to renew my subscription. Phil Ameu

Puzzle saga continues

Ether, Surrey

agree with several points in Mr. Godman's letter ("Sinister ring") I too fail to see how you can devise a consistently new format for a written puzzle. Perhaps once or twice you could. for example, ashans as an ordinary crosswordbut what then?

To my mind, a written puzzie needs to be no more than just that · a written ouzzle.

Being set in print all that weems to be necessary is that the problem should be clearly and fairly set out (though the problem itself need not be phylous): It should have a unique solution unless otherwise stated, and it should be most conveniently solvable by the invention and use of a program which can be run on the average micro (since it is after all written for a "popular" computer magazine). What else is needed which is not merely a funcy waste of column inches?

But do your allegedly discontented readers really want a true puzzle at all? It is probably uncharitable to suspect that the "overwhelming demand" comes from those who find the puzzle in their existing format too difficult and/or too much trouble; and that what they are really after is an easier crack at the \$10.

Perhans the "overwhelming demand" is in effect for some sort of quiz rather than a true puzzle, with questions like "Who runs Amstrad computers? Tramiel, Sinclair, Sugar or Dr Runcie?" I suggest that there are too

many of these already, and that they are in any case screamingly straight loctery. Perhaps this is what you will end up with - perish the thought!

Or perhaps an "overwhelming" number of solvers find the puzzles too easy, and are tired of waiting for their names to "come out of a Somehow I doubt it. Only you

know the true reasons for the "demand", and you haven't specifled them

Please may we have our nuzzles back as they were? They were usually of just the right standard, and I thought the setter(s?) did an admirable job. Like Mr Godman, I buy PCW mainly for the puzzle. III

magazines which don't have one. incidentally, when can we exnect the solutions and winners of

> M W Peters Riandford Dorset

We've been pleasantly surprised by the volume of support for Mr. Lee and his puzzles - but puzzled by the fact that it's taken the temporary disappearance of the puzzles to provoke it.

The good news iii that the puzzle will be returning as before very soon - either next week or the week after.

As for your suspicious mind. Phil Amey, shame on you! You clearly underestimate the respect we have for our readership if you think we would not keep you all fully informed about an issue which is obviously of such

In addition, your idle and mistaken speculation upon the private dealings between us and our puzzie compiler is, shall we say, less than constructive? What about informed contributions like this next one - Ed.

Join hands

would like m request, through your magazine, those dynamic software dealers that the Zambian computer scene is expanding oriekly though still at infancy willing to join hands with new distributors are welcome to contact me at the address: Crispin Lavu

Infordeal Consultant c/o PO Box 30029 Lusaka, Zambia, Central Africa

Surely some mistake? am doing a project on "Alterna-tive Medicines" for my General

Studies AO. I obtained your address from research into the book "Healing Without Harm", so I decided # write and see if you would be so good enough to help me in anyway with my research.

As I have said I am doing my General Studies AO, which means I am in the first year of the sixth form (ie starting "A" levels).

I am enjoying doing this project very much, and I have learnt a great deal from doing it as in the beginning I hardly knew what it was all about, I would be very grateful if you could in any way help me and look forward to hear-

ing from you. Sandie Delmar-Moronn (Miss) Horsham W Susser

Protect the dishonest

m writing regarding the two letters printed in Vol. 8 No. 44 regarding poor service received from mail order companies. I have III ask what was the point

in printing them at all. Surely the idea behind the writing of such letters is for the author to air his grievances about a particular company and III warn other readers from falling into the same trap. Therefore by not naming the companies concerned you have rendered the letters pointless. In effect by not naming the two

companies concerned you have protected the dishonest at the cost of those who try to give a good service. The net result of all this is that at a time of the year crucial for mail order companies' survival. you have in effect persuaded a large number of potential customers not to buy goods via mail order.

The end result is potentially type of letter continues than we and no doubt several others of your advertisers may well question the wisdom of continuing to spend money on advertising in your madazine whilst we are unnecessarily condemned and - if enough duride this way - the magazine could collapse through lack of revenue.

Anonumous Mail-Centa Belper, Derby

How wrong you are. By not naming the companies concerned - by agreement with them, by the way - we were avoiding the danger of legal action by thum We tried to contact both companies and printed the letters to show the readers in question that it is worth contacting us if problems are encountered with one of our advertisers. Surely you would agree that

your primary responsibility is to your customers. It is after all their money you spend when you Here at Popular Computing

Weekly we are constantly amazed by the shoddy service customers receive from computer companies, large and small,

We have a responsibility to our advertisers certainly - but we all, press and advertisers alike - have a greater responsibility to our readers and your

It is for that reason that we take up their operies. We accept that companies like yours provide a good service, but until the fi industry as a whole shapes up, surely you and we must declare open season on companies which fail in that responsibility.

We are in a dllemma. If we name companies which are falling their customers badly, we risk being sued. If we do nothing, we are seen to be in league with disreputable firms. If we investigate, print a letter but do not name the firm in question, other companies cry foul. Surely reputable companies - unnamed or otherwise - have nothing to fear.

We're sorry but Popular Computing Weekly cannot guarantee to reply to all letters requesting a personal answer. It helps us enormously if readers are prepared to have general operies answered on these pages, so, if possible, please do not send SAEs.

AN IBM PC ON YOUR ST!

Special package of PC Ditto and the Triangle 54" IBM™ Compatible Disk Drive

PC-DITTO

PC Ditto is the superb new IBM PC emulator for the Atan ST which will run over 95% of IBM PC software! Coupled with our Triangle 51/4" Floppy Disk Drive you immediately transform your ST into an IBM PCI

PC Ditto, the official UK version imported by Robtek. is almost fully compatible with the IBM PC. Running in software, it operates in all screen resolutions, offering VGA and CGA graphics capabilities.

5¹/₄" IBM DRIVE

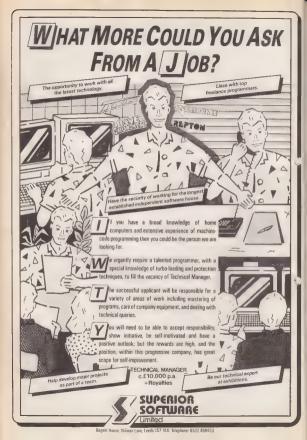

Of course, the only way III get IBM software into your Atan ST used to be to transfer the files across the serial ports using appropriate comms software. Not any more! The Triangle 5½" IBM compatible disk drive allows you to not only read files off an IBM 5% disk, but to write them back again. The files can then be read by a proper IBM machine without even having to think about serial ports, baud rates, handshaking or Xmodem!

The Triangle 51 " disk drives also operates as a normal ST disk drive (but with 51/4 " disks of course!) and can format to either the ST's normal 720K or. using special software provided, the standard IBM 360K (8 or 9 sectors per track). For IBM mode, the drive is switchable between 40 tracks (IBM) or 80 tracks (ST).

PO-Ditto and a Triangle 5% " IBM Compatible Disk Drive costs just £1991

Fight to the top

After a long wait, the game that launched a thousand Amigas has arrived for the ST. Defender

of the Croum.

The time is November 1149
and dirty deeds have been perpetrated. The king has copped a cone-way iteket to the great four-amment in the sky and the king-dom's ill a bit of a mess. Saxons and Normans are blanning each other and warfare is about in erupt across the green fields of Deneland.

You play a decent law abiding, pure of beart Saxon lord, with his own castle in the country, and are determined to wipe the scummy Norman filth clean off the map and claim the crown for yourself.

There are three main options available to the man (or woman) who would be king; seek conquest, hold a tournament, or go raiding.

rating, initially, all territories except those containing casties are unclaimed and contain vassals who are only too willing its join your force. As buying an army, be they soldiers, knights, catapoits or small castles, takes up an eatire game turn, the best bet to start with a to bittakrieg the countryside and avoid opposing "ratles. Tibs way you can gobble "gartles."

urmies. This way you can gobble up territories, which put varying amounts of gold into the castle coffers, and mop up lots of floating vassels. When you go home there's a huge pile of swag to spend on building a really big army.

You'll need a large pack of Saxon troops to take on the construction of the constructi

In addition to reducing the wall to rubble (an undamaged one doubles the defensive strength) you can throw Greek fire into the courtyard to make things even hotter for the residents, or even lob a dead home over to surred disease.

One of the areade elements is that you are responsible for firing the catapuit, and it's by no means as easy as in the Andga original, which was too easy. Should you win the day and talke outnour's bonou castic, then they are climinated from the game and you take control of all their lands. A couple of interesting points are that you can be given safe passage through Saxon lands, and that you only have

to capture all three Norman castles to win the game. The other main option is hold-

ing a tournament whereby you can joust for leadership points or

Jousting represents the next of the arcade sequences, in that you see your opponent thundering towards you, and you have to point your lance, which bounces up and down wildly, at the very centre of his shield and click the the mouse button when you hear a metallic elanging sound.

Your third option is to go raiding, which involves two swordfights, one in the enemy castle's courtyard, and one iii the

Although none of the characters would give Errol Flynn a moment's worry, the swordflighting in certainly good fun.

If you win both fights then you

If you win both fights then you get to plunder the castle's treasure room.

The adult entertainment aspect comes into play when a Saxon lady is kidnapped by the Normans. To adult being called by the Saxon lady is kidnapped by the by Journey by your men you must stage a rescue. This involves repeating the raiding scene but this time the raiding scene but this time the raiding scene but this time the raided scene but this time the raided scene but this time the raided scene but this time the raiding scene but this time the raiding scene but this time the raided scene but this time. Saxon dozies shows her gratitude by inviting you list her be bed-chamber. In a couple of humorous, but mertly tasks, cornex her mertly tasks, cornex her

u obliging wench becomes pledged r to you.

This has two side effects One is that her piecy appears on the map alongside yours and that your men fight better in hattle. The second is that whichever Saxon lord was her protector, bows out of the same and hands over his lands to you. Well worth the effort really. Let's talk about the graphics, which after all were the selling point for the original. A couple of superfluous scenes have been cut, but the main ones. are still there. I could expend lots of words like fabby, exceltent, brilliant, until it became pauseating. And it would all be true. But the most glowing comment must surely be that on the ST, the graphics are virtually the same as on the Amiga original.

Defender of the Crown on the ST is a lot more difficult and more challenging than before, and, unless you want to watch endless repeats on the TV, essential entertainment this Christmas.

Oh no, it's back to the dungenns. Why can't people set computer games in interesting places. Like a Ferrari dealer showroom or a Banglook cathouse. Instead we have to put up with scenarios that sound like the deranged ramblings of a terminat Genesis fan in the last stages of Tolkiens' disease.

With Spellbinder we're in a place called the Castle of Lorraine, which sounds like a plug for someone's girlfriend.

The basic plot is like all the other basic plots you've ever heard and contains people with silly names, such as 'Magelord' and 'Eldon the Spellbinder'. Essentially you have to explore the castle to find and collect the lagredients for a powerful spell. There are all the usual castle.

type things. like one-way doors, secret passages and, um, teleports. While you're wandering around, picking things up, examining other things and generally having a cool time you tend to bainp lato ansty creatures, like Deathmonks, Zombies and Forest Hags. A couple of those can spoil your whole day, though you can cut spells to healy ourself.

Rising another attack of rheumatism, I starred my exploration of the castle. This is a graphic adventore in the Knightore tradition, and at first sight the graphics are quite pretty. They're monochrome, but come in a range of colours and are detailed, and your character moves smoothly around the

After a while, however, all the locations start to look the same. If you haven't already got well into the game by then you'll probably just give up, as I did. It think I'd rather have a real

screen.

adventure game and do without graphics, or have a good fast arcade game. Some people will doubtless love Spelibinder, but frankly 1 sm on the side of the Deathmonks.

Steve Mansfield

Program Spellbinder Micro BBC B Price £9.35 (cassette), £11.35 (5.25in disc), £14.95 (3.5in disc) Supplier Superior Software Ltd, Regent House, Skinner Lane, Leeds LS7 IAX.

The latest release from Melbourne House puts you in the starring role as cartons supersienth Inspector Gadget, chief investigator of the Service. Inspector Gadget has been sent by his boss Chief Quigley to investigate a series of mysterious going ous that have been occurring at

the international Gircus.
Together with his ever faithful companions, Penny and Brains, his pet dog, Gadget enters the circus. The three of them then started their investigations by entering the Big Top, unfortunately, for Gadget, a loose EXIT

sign swung down and knocked him flat out. Having recovered from the ac-

Having recovered from the accident, Gadget awoke and realised that Penny and Brains have gone missing. What Gadget first thought of as being an accident was no more than a devious plot by the wicked MAD organisation to undermine Gadgets investigations.

Now they have got Penny, Gadget must find her and ensure that MAD don't start a world war. Unfortunately for Gadget, as he was lying unconscious this special gadgets were stolen.

findget is unable to get into action out? Bit can find all his essentials. And this is where the 'fun' of the game starris as Gaderivistic Bit the areas of the circus after his gadgets. Without the gadgets, Magget is anable to arrest the MAD spies. Time is of the essence, the future for Penny resis with Gadget, indeed the future for the world resis with Gadget.

What a brilliant plot for a game, what wonderful attaches a wonderful attaches the common plot of the common

Although not one of their best releases, Inspector Gadget will appeal to all Gadget fans, and the music is so good, it should be able to sell the game on its own.

£150.00

Anyone who watched the fasci-nating BBC2 television series on test pilots about two months ago will be pleased to hear that there is now a game that can recreate this 'seat-of-the pants' type of flying; Chuck Yeager's

Advanced Flight Simulator, Programmed by Electronic Arts, and released in the UK on a variety of machines - In this case the Commodore 64 - by the European arm of this well re-

spected software bouse. As with the rest of EOA's games, this AFS comes with a leagthy and well written manual which is essential reading for anyone attempting to get the most from the game - especially if you are a flight sim enthusiast. Graphically, APS is excellent, although as you would expect of

the Commodore 64, the animation is not exactly fast, though by no means unplayably slow. In play the game allows you to

sample the delights of 14 different planes, ranging from Sopwith Camels to "Top Gun' like F-16 Fighting Falcons. To add to the problems of being a test pilot, there are also three experimental

The most obvious comparison to make is with Flight Simulator 11. the industry standard simulator from Microsoft, Although APS is not quite as smooth or relaxed, it more than makes up

for this with action and 'thrills'. The philosophy behind the game li typically American, but thankfully Chuck Yeager seems more endearing than most, and even quite amosing.

"Crash is not a word pilots ever use. I don't really know why, but the word is avoided in describing what happens when several tons of metal ploughs itself and its pilot into the ground. Instead, we might say "He augered in." Or, "He bought the farm!

Overall, AFS is a game that will appeal to everyone who has wondered when simulations will start m bridge the gap between arcade games and simulations. Daniel McGrath

eviathan could be the greatest game since Space Invadera. but anything that uses a dongle gets too marks in the pain in the backside department. Yes, in this Amiga incarnation, it's wrestling time as you evict a defenceless mouse from its home and replace it with the sawn off end of a joystick plug.

Enough of that though. Now to the plot. Refreshingly, English Software hasn't bothered with one. Just fly your ship, Leriathan, over (and into with sickening regularity) three types of landscape, each one being presented in a couple of different colours, and destroy every enemy ship that you find. All within the time limit. I liked that; completely appretentious stuff. As usual your ship is contin-

ually running out of diesel so tanding on the arrows near the fuel pods in the Cityscape is recommended rather than the take a spare can approach. On the control panel at the

bottom of the screen there's all the regular guys; score, fuel counter, lives indicator, timer, value of BP shares, and a couple of new ideas. One is a snapshot of the type of enemy coming next while two arrows flash green to point ill which direction the enemy is actually lurking.

In play Leviathan is a Zaxxonstyle game, but much better. The screen scrolls diagonally up and down, and does so very smoothly when you're moving at top speed. The graphics for the landscapes are made up of shades of one particular colour at a time, enabling detailed shadowing and similar effects m be realistically portraved.

It's nice to see a game that actually looks like it's running on an Amiga rather an ST, and the Greekscape in particular is de lightfully done.

The music on the title page, by the prolific David Whittaker, is up to the mark without being in the jaw dropping class.

Still, this Amiga version of Leriothan in easily the best, and one for the Christmas stocking of those who like mindless action games.

be game that launched a thousand space pilots is now available on the IBM PC and compatibles. Along with Starglider. Elite must be the most eagerly awaited conversion, and those who glimpsed it at the PCW show will know that this version has something special - a solid 3D option!

For the few who have never heard of Elite, it is quite simply the best 3-dimensional snace combat game going. You pilot a Cobra Mk. 111, m ship well-suited to both combat and trading. Trading is an integral part of the game as you need m increase your credit balance in order to afford all those cute little accessories, such as docking computer, military lasers, fuel scoops and so forth. However, piracy and bounty hunting can also grove profitable. The aim is in crease your rating from 'Harmless' to 'Blite'. However you should be offered your first mis-

status . . When you load the game (the disk is not protected will copy straight to hard disk), you may select either Shaded or Line Elite, Both utilise low res. and four colours, and these are hatched to produce shading varlations on the control panel and ships. Firebird recommend an 80286 micro at 6Mbz or higher to appreciate the solid unimation, but the PC1512 display is adequately smooth.

sion before reaching that coveted

Before play starts you are prompted for a word chosen randomly from the enclosed novella-

time to the Blue Dannbe Waltz. The shaded Cobra looks very impressive, although you might catch the odd screen-swap flicker on a PC1512, it's still remarkably smooth.

Unable to resist an immediate test flight (and having flown Cobras before as a Beeb!), I promptly bit F1 and launched into the cold vold above planet Lave. The PC key favout iii easy to adjust to, and I was soon skimming the space station, wondering if it was worth annoying the local police fleet? Commonsense said No, but I opened up on the station anyway, Instantly a stream of police Vipers erupted from the dock opening and commenced to return fire. I counted

10 of them before my career as a Cobra pilot was abruptly curtailed, and the screen displayed

scale of 1-10 (highest), with '8 being the default. Unfortunately this also seems to affect the frequency with which the key board is scanned, so while '10' offers the smoothest animation ii loses you accurate steering and your Cobra tends to veer at the lightest touch. On the Amstrad I found the default of '8' was fine for combat, but docking required setting of '1' (at least until I can afford a docking computer!).

There is little doubt that IBM Elite is a masterly conversion. The shaded space stations are most impressive to behold as they rotate majestically against a backdrop of drifting stars and distant, blazing sup. Also impressive in the circling attack manocuvre taken by police Vipers as they dart from dock. By round the space station in a chain, then pursue you and set up a circling attack formation around you. Very pretty though somewhat lethal to watch. The most pleasing image was that of two incoming missiles on the rear view screen, rapidly gaining ground, but lost just before impact as my Cobra completed count-down and teapt into the colourful display of Hyperspace.

Elite's appeal was always longterm; with over 2000 planets to trade with and the clusive rank of Elite to be gained, not to mention the occusional mission on behalf of the Space Navy. there is always something to do. It's destined in he the most

popular PC game this Christmas, if not this year. Pete Ginty

CXXXIII.

Remember the age old game of Defender, where the object of the game was to fly across a planet and rescue humans from aliens who were going to turn them into zombies

The folks at The Edge seem # remember the game particularly well. Unlike a lot of copies of that all time classic. The Edge have taken Defender as a basic plot and expanded on it. BISK is primarily a shoot 'em up but it also contains elements of strategy in the actual gameplay as you can equip your spaceship with various objects as you set about customising the ship.

You can add thrusters, boosters, retros infact a whole host of objects that will help you seek out and destroy those offending

allens. There are several different objects involved ill the game. The first is to explore the planet Christon 3 and destroy the aliens

who have occupied the planet. Further objects involve you having to rescue as many scientists as possible from the planet and eventually find the underground complex to get hold of more fighting power and the blumprints of a top secret weapon system that was being researched on Christon 3. Graphics are large and detailed.

The mountainess terrain, looks very realistic but it's really no surprise as apparently a lot of work has gone into the writing of the game by brothers Chris and Tony West.

Controlling your spaceship is done a la Defender in that you are positioned horizontally and there is a box on the top of the screen showing you where the aliens are coming from and how near they are to you

The music on RISK is very good and is very reminiscent of a theme tune to some top sci-fl adventure film.

It's a real shame that during the actual playing of the game there is no music playing. The only sound effects are of

you shooting at the aliens. It would have been alee if the

authors could have let the music

from the introduction run late the game. What could have been considered as a 'rip off' of an old same

has turned out m be a game with added originality It's pleasing to see that old ideas can be taken to and brought back in a modern way. Congratulations to The Edge. How about bringing out a new version of Asteroids or Space

Invadero, Edge?

ncentive has been talking about its 'Freescape' technique for a while, but at last here's the finished Spectrum version of Driller, with CBM64 and Amstrad in follow. Was it worth the walt? Yes, especially if you've

OF HEATHER)

enjoyed games like Mercenary and Sentinel. Driller gives you a solid 3-D landscape, with objects that you can walk round, walls you can climb on (and fall off?) and the ability to look in any direction. Look up as you walk through a passageway and you'll see the roof going by, and if you raise your viewpoint when you come to a wail you can look over

into the next playing area.

Control requires most of the keys on the keyboard, though a Joystick makes life easier; Kempston, Sinclair and Cursor are supported. Even with a stick you'll still need another 16 keys! These enable you ill look up and down, tilt left and right, do a Uturn, rise and fall vertically and teleport drilling rigs.

Drilling rigs? Well there is a game in here as well! It takes place on Mitral, where a build-up of gas beneath the surface needs an experienced driller last like you w explore Mitral's # sectors and place the drilling risk III the right spots to relieve the pressure. You also only have four hours (real-time) before a meteor hits Mitral, and if the gas prob-

lem hasn't been sorted out by then the resulting explosion could mean the end of civilisation as we know it. With a potential playing time of four bours, it's as

There are 16 controls around the main viewing screen, so I won't me into all those, but some of the more sensible include the ability m alter your rate of movement and the angle through which you turn round when you look to left or right. Briller does take a while to get started, as you try to get used iii everything that's going on, but it renays the

Driller has lots of amusing touches. Not a fast-action shoot 'em-up, and I've a feeling the Freescape technique will produce even better dames than this, but it's a good (if pricey) start. Mike Gerrard

Program Driller Type Adventure Micro Spectrum Price £14.95 (tape), £17.95 (disc) Supplier 2 Minerva House, Calleva Park, Aldermaston, Berkshire RG7 4QW.

See C Signor

The first C compiler for the Acorn Archimedes has appeared. David King concludes that it is not all that it could have been.

corn currently has two versions of the however a floating point emulator is sup-C language in their software catalogues, and one is 400 times faster than the other! I'm referring to Acornsoft C for the BBC Master Series, and also Acorn C (notice the lack of 'soft') for the new 'BBC Micro', none other than the Archimedes.

These two products serve to underline just how many worlds apart Acorn's old 8bit BBC work-horse and the new 32 BH super-micro are. It is not just speed of course; with the 8-bit C language you are restricted to fairly small programs because of memory limitations, and run-time code is not true machine code, but an intermediate interpreted type, which is also nonportable. The Archimedes on the other hand has pretensions to being a full-blown Unix work-station, and so C forms an extremely important part of the new machine's initial repertoire of languages.

Programming C

If you want to program in C on your Archie, you'll need a ! megabyte machine - either an A310, or an expanded A305. The version of C we looked at was a pre-production release, and this was openly admitted and warned about in the documentation. Acorn has had ARM (Acorn RISC Machine) C now, and according to details supplied with the version we had, our version was a recent release originally written in C itself. We ran Norcroft release 1.40. Acorn have opted for the ANSI (American National) Standard for Information systems) standard, which should mean good portability across the already crowded spectrum of rival C compilers on other machines.

Features

The package has all the basic features you would expect from a professional C compiler, a linker is included (an essential part of a C system but often supplied as an 'extra'!) - though ours wasn't documented! Nevertheless, there were no surprises here, and users familiar with other commonly available systems shouldn't have any problems getting started.

The Archimedes doesn't currently have any floating point co-processor hardware. plied, and you're directed to have this present when using the compiler

No editor is supplied, though Acorn programmers swear by their in-house developed Twin editor - a multi-tasking version of Edit as supplied on the Master 128. We didn't have this but got by using View under the Archimedes 6502 emulator! There's no debugger either, which could put some professional applications houses off.

The pre-production compiler on sale at present does have some annoying bugs, but these are not too serious and they are

shot R a typica: B program in action

documented. Some limitations are also evident, like the lack of linker documentation, and the lack of flexibility in some features - the stack is fixed at 16K for example - but addendums supplied promise to shore up these weaknesses in fater releases.

Acorn C has a standard library, once again with nothing basic missing. Extensions to the library include graphics calls basically links to the extended graphics in the Archimedes' Arthur operating system. plus the ability is use what was referred in as the Arthur WIMP system

We didn't have time in test this feature but assume this is a reference to the Archimedes Desktop Windows module.

A Sieve of Eratosthenes program is supplied, and we used this to find the first 1899 prime numbers. Execution speed of the resulting ARM code

Sneed

was impressive - just 0.58 of second. This compares with over three minutes for the poor old Master 128 running Acornsoft C. For some reason we were unable to get Beebug's C compiler for the BBC to accept the example program. Brasscourt C for the BBC Model B, which compiles true machine code, was much more impressive at 38 seconds, but still over 60 times slower than the Archie. However rather more relevant comparisons disappoint. Running the same Sieve program on both Motorola 68020 based NCR and Intel 80386 based Altos Unix multi-user systems, the same program ran three and five times faster

This has to be down to the compiler, and perhaps the early 0.20 release of Arthur in our Archimedes. The Archie's ARM is capable of matching, or even exceeding, the performance of either a 68020 or an 80386, so we can only deduce that those machines have better optimised compilers.

However this probably shouldn't be all that surprising Acorn C is currently the only commercially available C compiler for the Archimedes and will probably benefit greatly from further optimisation in later releases. Acorn will send later releases to current users as long as they receive a user-registration coupon supplied with the original package.

Conclusion

respectively.

Perhaps this initial release of Acorn's C package is a touch disappointing, but it's still good enough to get going with, and certainly very important for Acorn's crusade to get the Archie recognised and installed as a powerful business/utility workstation.

The dotted line syndrome

If you are thinking of selling computer games, or already do so, David Lester has some handy advice on signing contracts, how to avoid financial disappointment and how to tackle legal wrangles.

ost programmers are on something of a high when they finally agree on the terms by which MegaBucks Software Ltd. will publish their latest hit. Their eyes fill up with pound signs and unfortunately realism takes something of a

Signing a contract

When you negotiate a deal with a software house for it III market your game. they will usually require you to sign a contract. I was staggered recently when the Hewson programming experts left to join Firebird - and it was revealed that there had in fact been no written contract. I would hazard a guess that in the future all software houses will require programmers to sign a contract. They do say one learns by one's mistakes

But this is not something to be afraid of - but rather, something you should push for as programmers, since the contract is there to protect both parties, and might end up your only means to get what is owed to you. Contracts have been used widely in the industry ever since it began, and they are usually fairly similar. But, as history has shown, you should read anything through very carefully, and be aware of what you are signing before you pen your scrawl on it.

Unfair Terms Act

The English legal system is such that the contract may not be the be-all and end-ail of any agreement. If you sign a contract which later turns sour, you may have some comeback under the Unfair Terms Act - which over-rules any written contract under certain conditions, and may help you. Being under 18 might also help, but don't rely on it, if you can sign something you are happy with, do so.

Verbal

Another interesting, and little known, point about the law of contract is that a contract need not be in writing, it can be spoken. So if ■ firm offers you \$10,000 for the UK rights to your latest Juniter Ace program over the phone, they can techni-

cally be held to it; the problem, of course, is in proving that they made that offer. For any contract to be valid, there must be an Offer ("I'll give you £1500 for that Spectrum game"), Acceptance ("I accept") and some sort of consideration (in our example, the \$1500 from the software house, and the UK rights to the Spectrum game from the programmer) although it

doesn't matter how much - a penny will do. There is a lot more detail than that, of course, but generally speaking if you have those three elements, then a contract exists which is legally binding. The law is currently changing, or about to, concerning the ability of minors (anyone less that 18, for your information, John, not someone who works underground!) to make contracts, if this is relevant to you, it might be worth your while checking with a solicitor about this

Signing a contract

So, what are the main points III watch out for in publishing contracts with software houses? The basis of the contract will explain who both sides are (ie, you and "your agents" and the software house, and their agents: for practical purposes, this

> ⁴⁴The English legal system is such that the contract may not be the he-all and end-all of any agreement . . . 97

merely means you and them!). It will then explain what the contract does: usually licensing the rights to manufacture, market and distribute your software title, or the copyright to it; it will then have a section about what "consideration" you are

being given for licensing these rights, ie. the royalty arrangement you have negotiated, or the lump-sum payment, or

Copyright

Most programmers I have come across like to maintain ownership of the copyright to a title, and simply license the rights to it. This then gives you control over sub-licences, and the rights to any income earned from subsidiary products (such as T-shirts sold with the game name on it, etc). That is, assuming that you do not assign these rights to a publisher, too. You might not think that this is desperateimportant, but just suppose that your program really hits the big time: there have been instances where board game manufacturers have converted a software game to a board game; and where arcade game firms such as Taito or Sega have bought the rights to a home computer game for conversion into an arcade game (for example, Star Glider), While this is pretty rare, you would be none too happy if you saw nothing of the profits of these licences. My advice in therefore to only assign the precise rights your publisher Al

Publisher's rights

The other side to this coin is that the publisher will usually make you sign = clause saving that you guarantee that you own all rights to the product, and will protect the publisher from any infringement of them. This just means that if anyone starts producing copies of your title which are a bit too close for comfort, the publisher can make you sue, they cannot sue themselves, since they are not the owners of the copyright. This could get expensive, so the first time I saw this. I felt decidedly worried about signing it. But if you are with a reputable firm then they will probably help you out financially if it comes to this (which is very unlikely anyway). And if you are with a smaller firm, then they will probably be less keen m sue anyway. You can be fairly happy about this simply because the publisher

will be even harder hit than you by any infringement, so it is in its interests to help you sue.

Royalties

Then comes the mysalty or payment clause. It is impossible to say what you can reasonably hope to get. The best thing to do is just to show the game Besverai publishers, and take the best offer you can get (never just accept the first offer you can are made, just in case...; there are less programmers ripped-off now than there were "in the early days", but it still happens from time to time).

For budge storm under country.

For budge stormer titles, an outright payment of about \$1,000 to \$1,000 its fair, unless you are dealing with one of the big three firms, who should double that figure. The best thing by far, though, it is cobrain an advance on royalities, so that if asless really do take off, you get a pleece of the action. I have only come across two firms which referee the control of the co

which reliased to offer royalties, as you which reliased to offer royalties as you will be able to regardless such a deal. On full price, able the regardless such a feel, of full price, able the able to read to the able to read to the able to the

This is the clause to check, recheck, and check again. Simply make sure it says what you agreed with the publisher, and nothing sice. Note how aften the coyalities are paid, too, some firms only pay them once a quarter (every three months) which means that you won't see anything for a long time after you have finished the game. If you possibly can, negotiate this diwns to monthly payments, while you

down to monthly payments; while you should still get the same sum, if your firm goes hust after two months, at least you will have had two months' payments rather than none! (not to mention any interest earned on the cash).

Conversions

You should make sure that the contract is clear about arrangements for conversions of your game to other formats. (assuming that you are providing it one or two yourself). This can be an extra source of income which might make yourself more of two yourselfs. This can be an extra source of income which might make only more money even than the original, so don't sign away your rights to morely here. One publisher I have come across claims that its contracts often a tensile your form conveyions - if so, don't sign away programmer to any of the processing from conveyions - if so, don't sign if

If you think about how many formats some games are available on (with 8 and 16 bit, there must be at least 9 relatively common ones) that is a lot of sales. As copyright holder, you should be entitled to at least 25% of what the converter gets for

the new versions. Talk this over with your software house, they should be quite happy with this arrangement, and you can her include it in the contract. You should also take into account whether or not you sheep the right in Gernes out conversions to keep the right in Gernes out conversions to publisher of the original version doesn't publisher of the operation of the publisher of the Spectrum or Commodore, would you be allowed, under the terms of the contract, to lecture a second five contract, to lecture a second five, respectively, of the game. If not, you guilt in the Spectrum or Commodore version, respectively, of the game. If not, you

Overseas sale

Similarly, make sure you are happy with any arrangements for overeese sales. This is clearly couchi if your game is likely to be alt is smewhere like the United States, but if it is a small-time UK-only game, it if it is a small-time UK-only game, it any arcade game, and most good circular, adventure, or shouldard games, thore could well be large markets overeneas or your program. There is usually an extra clause dealing with this, which usually crearing the country of the country

44The main point is to avoid at all costs signing any sort of exclusive agreement . . . ***

with which I was not happy (unlikely, but you never know) and negotiate a fairly high proportion of sales revenue for these sales. After all, there is not much work involved at that stage - the artwork and packeging has all been done, and the costs of actually producing the tage or disc are extremely low. It's just a case of using your worn judgement about what is either fair, or the fairest deal you can get (not always the same, unfortunately).

Sub-licensing

This sub-licensing is more important mow than it used to be since so many titles are released at first on their own, then later as either budget titles, or on compilations, or both. Of course, when you first sign up a contract, you have no idea whether this will happen or not, and if so how much revenue will be generated by many the sign will be generated by many the contract will be generated by the dead of the sign of th

That way, you might have a better idea of the likely success of the budget title or compilation, and be able to get a better deal for yourself. The software houses might not be too keen on this, though, since it is a very locrative sideline for them, but sick up for your rights: it is, after all, your talent (and that of their other programmes) which scars, their living for them.

There are two other clauses to note, one you should try to include the other you should try even barder to exclude! Firstly, you should incorporate a term of the contract about what hannens if they do bust, or are taken over. If they get taken over by someone who doesn't like your game, sales could literally ston dead, and with them, your income! You need to specify the different types of possibility here in some depth as people have been caught out before by excluding one or ship, bankruptcy or being acquired by a third party"; should any of these events happen, you then automatically own any rights assigned under the contract once again, and as such are free to so and resell them to a new firm, if you can find one interested

The main point is to avoid is all costs signing any sorr of exclusive agreement, whereby you agree to (and are legally bound to) offer the publisher of your current title first refusal on all subsequent programs for the life of the contract. Under an exclusive agreement, the soft-ware house can get away with a paying you carried the programs for them any power of the contract. One to avoid, offer them any profess of the contract of the contra

Protect your interests

There are no many answers to protecting your interests, and none which will gaurantee anything. If in doubt, po elsewhere, and the state of the protection o

A tight contract will only help you if there is someone, or firm, has enough readies to pay your debt and costs. Otherwise, even the law on't be able to help. So why bother? Because without a decent contract which protects your interests, you are definitely sunk. It's a great world, isn't is

Eastern Delights

Mark Jenkins with computer news from the heart of it all . . .

hanks to the Yamaha Corporation Of Eurone, which has recently been setup to co-ordinate Yamaha's activities in the UK, France, Germany, Spain, Italy and elsewhere, we recently got a chance to fly over to Japan to check out next year's new products. As far as Yamaha are concerned, the main line in computer music is the CX5 series, which as you'll probably know is in a state of flux in the UK. However, thanks to Yamaha's "X-Day 6", a trip to their retail store in the Shibuya area of Tokyo, and various other exhibitions, we have managed to gather quite a lot of information about the state of computing in general, and music computing in particular. In the land that does all

that sort of thing best . . First, the CX5 series. Users who have been (rustrated by the apparent deletion of the line due to the failure of the MSX standard in the UK will be pleased (or more frustrated) to know that it is going strong in Japan, Spain and Germany still take large numbers of MSX computers and the home market is healthy, so much so that two expanded models - the CX5HII/128 and thge CX11 - are currently available. These are, of course in addition to all the other MSX machines from Sony. Canon, Toshiba, Mitsubishi and many others, which can be used as music computers now that Yamaha have made their SFG-05 FM synthesizer cartridge available

separately. A music computer is only as good as its software, and currently Yamaha Janan offers a long line of options. The full list runs as follows.

Computer Music Workshop; Keyboard Chord Master, Keyboard Chord Progressions, Guitar Chord Master

FM Auto Arranger: FM Auto Arranger Utilities · Graphic artist; Graphic Artist Utilities

FM Voice Data; Vols 1, 2, 3 DX100/DX27 Voice Data: Vols. L. 2 DX 21 Voice Data; Vols. 1, 2, 3

RX15 Rhythm Data; Rock Vol. 1, Vol. 2, Swing/Shuffle

RX11 Rhythm Data; Rock Vol. 1, Vol. 2, Swing/Shuffle RX21 Rhuthm Data, Rock Vol. 1, Vol. 2 Music Pad, Music Pad Accessories

The last of these, the Music Pad, is a chunk of hardware similar to a flatbed plotter which allows you to enter music. arrange pieces and create new sounds using a plotter pen to control the computer. Yamaha also make a word processor available for their MSX machines, and use the CX11 to run automatic testing routines at their DX synthesizer factory in Toyooka.

The most popular MSX line in Japan seems to be the Sony Hit Bit, which can be built up into a complete business system. If you don't want to use a keyboard, this can be run from a tiny numeric control pad with just 0-9, cursor, and function keys, and you can clip on a 300/1200 bps MODEM to communicate with music networks such as PAN, IMC and ES1 Street. Similarly, Panasonic's 32k MSX computer has an optional clip-on "MSX-Audio" cartridge called FS-CA1 which gives it polyphonic synth voices for use with packages such as the standard "MSX-Music".

If you really want to integrate your music, hi-fi, computing and TV interests, the Fulltsu FM77 AV/AV20/AV40 is the one for you. It's described an Audio-Visual Computer and comes with a powerful polyphonic sound-chip, two disc-drives, TV, keyboard and hi-fi sound outputs. A MIDI interface, the FM77-40 is optional, as are various boards to add SCSI (hard disc) interfacing, e-mail, and what looks to be a voice-activated control system, or perhaps just a sound sampler.

The FM77 is shown being used for computer-aided design, MIDI control of Yamaha, Korg and Roland synths and effects (using a package called FM Music World created by Fujitsu and Music Plan & running an FM Music Editor, creating abstract graphics, doing word processing and accounting tasks, and generally being a bit of a jack-of-all-trades.

Of course, it's hard to give an idea of the cost of the machine since so many options are available. Prices in Tokyo are high now due to the strong Yen, but to give you some idea, the Apple Mac and SE are about the same price in Tokyo as in the UK, so you won't in fact make any enormous savings on electronics by shopping in Japan nowadays.

However, if you're after equipment which isn't available at all in the UK, Japan is still the place to be. The country's leading computer graphics and music magazine, Ensilon, covers MIDI basics, digital mixers, photographic equipment, professional video equipment, computers from manufacturers such as NEC, Sharp and Panasonic, computer graphic tips with BASIC listings, drum machines, scanners, CAD packages, films, books records, and

Ensilon is largely in Japanese, but it is good to look at and contains tempting pictures of lots of items not yet available in the West. The publishers would no doubt be pleased to hear from you if you'd like to subscribe. Write to them in (straightforward) English c/o Studio Somewhere, 1-29-I Gohongi, Meguro-ku, Tokyo 153, Japan, Tel: Japan 03 793 0655 (9 hours ahead).

incidentally, non-Atari owners will be pleased to hear that the ST is very little in evidence in Japan, and that Yamaha seems to have no intention of flooding the world with ST-based software. However, one still suspects that the Japanese professional musicians are stealthily using Steinberg's Pro-24 and other MIDI music packages familiar in the West rather than more obscure packages for NEC or other micros. More Far Eastern stuff next week!

KENN GARROCH

A bit dense

G A Sansom, of Ornington, Kent,

I have read in your column a couple of times about discs and the different densities and formats. However, most of what you say seems to go right over my bead. Could you explain in very simple terms the various aspects of discs - with pletures if possible?

Starting from basies, a disc is a mund piece of plastic costed on each side with a layer of magnetic material (Fig. 1), This material El very similar to that used on magnetic tapes and if it is magnetised in one direction, stays that way until it is changed to another direction. At its simplest level, the direction in which the material is magnetised can be taken as a one or a zero and can be read back from the disc by a coil of wire which sonses the direction. This makes them easily written to and read as well as giving a pretty reliable system.

To store as much information as possible on the disc, its area is split up into tracks which are then split into sectors. (Fig. 2). Each section to the section of the section of the section of the formation stored. This sectioning of the disc is known as its format and offs is known as its format and purely engagetic let, the physical super of the disc is not changed to the information of the disc is not changed to the information of the disc is not changed to the information of the disc is not changed the super of the disc is not changed as per of the different formats.

abed under cultreast formats. A comman format is to split one side of the disc into 40 tracks, each having III sectors and each sector helding 256 bytes of Information, up to 100,000 r 1000 bytes of data. To find the first track, the index had been seen to the first track, the index had been seen to the first track, the index had been seen to the first track, the index position can be detected by means of a light beam shiring through it. Sector zero can then be found it.

allowing a certain amount of time to elapse before reading or writing - since the speed at which the disc is spinning is known.

and he seed or write the tracks, an arm holding the read/write head is positioned were the first and can be moved in and out in precise steps (Fig. 1) one for each track. To find track zero - usually safe as far as it can go until it his a stopper. This position defines track zero, and all other tracks position are based on offsets from this. Before a blank disc can be used.

It must be formatted and this operation is performed by taking the two positions described above let, rack, zero and sector zero, and then writing information to each track that spits it up into the correct sectors, Once this is done, a soughe of tracks are set side to hold the directory information is, lengthey are This directory information yet the sectors of th

There are a couple of ways of getting more information on a disc. the most phylogs of which is to use both sides in this situation, there is a read/write head positioned on each side of the disc giving twice way is to increase the number of from 40 to 80 An 80 track for double density) double sided disc with the sector format described before would hold 409600 or 400k hytes (1k is 1024 or 210), It is also possible III have quadrunts density but this is quite rare since it puts great demands on the quality of the magnetic material and the drive mechanism. To get 80 tracks the read/write arm must move as before - obviously things are getting a little delicate when it III moving half as far ugain.

Floppy dises come in four main sizes, 3", 3.5", 5.25" and 8" with the 3.5" and the 5.25" being by far the most common (Fig. 3). The formatting of these is pretty much as before and the number of tracks, sectors and bytes per sector varies from system # system, You'll have noticed that 5.25" and 8" discs have notches in their cases. This is for the write protect and if the notch is there, the drive is able to covered with a write protect tab (a piece of sticky foil), the hardware in the disc drive stops any information being written protecting the disc from harm.

When discs are manufactured. they are chated on both sides and than tested III see how well they hold the information. If both sides work well then the disc is sold as double sided double density. If one side has faults then it may be sold as single sided, and if both sides have minor faults then it will be single density. Since the disc is always coated on both sides, it can be used in a double sided double density system, but is not guaranteed to retain its data. I have a number of discs that I have used both 5.95" and 3.5", bowever, it is

not recommended. You should always buy the correct density and sides specified by the computer system manual, since most discs are guaranteed for life (1'm not sure whose but then I'm and Methuselah – yet) you will have no

One final thing is that Commodore disc drives don't use the index hole and so can be turned over allowing both sides to be used in a single sided system. You do have to buy special discs, or cut an extra write protect notch in the other side of the disc to make them work housear.

Fig 1 - the main components of a disk and drive seen edge on.

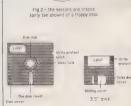

Fig 3 - the commonest disk types.

Testing time

G Woolen of Pelsall, W Midlands.

1 use three Amstrad com-puters, the PC1512. CPC6128 and the PCW8256, and find the Basic on

two of them quite good. However, I have hit on a problem with Locomotive Basic 2 in that the TEST and FLOOD commands do not operate. For me this is a serious problem in that I have persuaded my company to purchase a PC1512 so that I could write the required programs.

I have been in touch with Amstrad. Lacomotive Software. and Digital Research and though they were very helpful, there seems in he no solution to the problem.

It turns out that Basic 2 was written for use with the original GEM environment which was not complete What I find atranse is that when DR needed these commands for GEM Paint, they included them. Locomotive, however, didn't, but left the commands there anyway ie, they are in the mapual but don't actually work.

Could you please identify a Basic which is compatible with the Amstrad PC muchipe and which will support the graphics commands that I need. I would also like to know if other Rusic ? users have encountered other problems and ways of resolving them.

! think that Microsoft's GWBasic is the one you want, although I am not 1005, certain. Other possibilities are Borland's Turbo Basic and Quick Basic (MS). Since I don't use PCc's very often. I am not really an expert m the software available. The best thing would be to ring a couple of reputable dealers and ask their advice - possibly our reader's

Sound Out

T.F.McCabe, of Walton, Liverpool,

What I want to do is use my 520 STFM with an Amstrad colour monitor that I used to use with my CPC464. Thanks to you, the video connection is fine, the problem is the sound output. I know which pins iii use but I am a bit worried about what to connect it to. Could you clarify the situation please?

The manuals for the ST state that the sound output % ! Volt peak to peak but I cannot find the impedance which I

"assume to be around 1KQ. In plain English, this means that iii more or less matches the common 'nhane' jarut of most modern

It also more or less matches most modern (Walkman type) headphones. This leaves you with

three choices, a pair of headphones with the two channels connected to the single output for the ST, straight connection to an amplifier - the CD input is suitable otherwise one of the tape inputs

The final, and by far the most difficult is to obtain an amplifier especially for the system. I haven't got space here to detail this but basically it should have IkQ IV

862 speaker at about 10 Watts. Personally, I prefer the headphones since they cause no distorbance to anyone else, and they can

Coded

Phillip E Jones, of Anfield. Liver-

I wonder if you can help me? I am at University and studying a computing course, the system is using Algol 68 but so for I have only learned, Basic, Pascal and some Z50 machine code, I know that Algol 68 and Pascal are similar and that a Pascal compiler can be bought. But. I would like to know if there is such a thing as an Algot 68 compiler, and if so how much will it cost? If there iii more than one, which is best? I own a Spectrum 128K (the one Sir Clive brought out).

As far as I know, you are As in as completely out of luck when it comes to Algol III compilers, especially for the Spectrum. There may in an IBM PCc (small o stands for clone) version but I think that this is rather unlikely

The problem is that Algol 68 was designed well before the age of the micro-computer, in 1968 in fact. This means that any compilers for Il will be written for elephantine machines such as the ICL 1900 series, at least, that is the only I think that the best thing is do

would be to stick with Pascal and maybe c as these are the closest to Algol. If you can get ## grips with

Pascal, converting to Algol should he fairly easy Perhaps some of our readers

know of an Algol implementation

Driving force R Stevenson, of Islington, London,

I plan to buy an ST but need advice in order to decide between the following

1) Buy a 1040 STF 2) Buy a 520 STFM with 1 Meg upgrade and a Cumana 1 Meg

The second option would seem to give the conivalent of a 1040 and a second drive, for not much extra cost. But would it?

Is a 520 STFM with RAM ungrade really the equivalent to the 1040 (except for the drive) or would there still be some differences?

What about the drive? Would the external drive he able to do all that the 1 Meg internal drive does on the 1040 eg, when booting?

As far as a can see, the STFM plus memory upgrade plus IM Cumana drive would As far as I can see, the 520

come to approximately \$477 (1 didn't look for the cheapest prices \$480 and including a Comana drive this would come to \$619. So it looks as though you are right about the price advantage.

As far as I know, the 520 with a RAM operate should behave exactly like a 1040 since the operating system takes care of the additional RAM when the machine

Also, since pretty well all ST software comes on single density discs, it should all run from the internal drive. The only drawback with the system you propose is that you will not be able to boot from the external drive unless you. either fit the switch shown in P&P a couple of weeks back, or fit a double density disk drive (also in

P&P a while back). As I have said before my answers are all 'as far as I know' and I have been known to be wrong (ableit rarely) I would think that your best het would be the 520 + upgrade + external drive since it seems a far better deal than the 1040 + external drive.

Giving the boot

A Bradshaw, of Chorley, Lancs.

I've read a couple of times in your mag, people asking how to use auto running programs on I Med disks when their STPM's always boot up on the built in } Meg drive Pins 19 and 20 on the YM2149 sound-chip control the drives. switching these over, switches the boot drive. I have enclosed a

drawing showing how to put a switch in, this allows either drive to be drive A. Fitting the switch means desoldering the two pins, and cold soldering four wires, one wire to each of the plus, and a wire to each of the holes where the nins came from. These four wires are then taken out of the ST via the mouse/joystick port and attacked to a DPDT (Double Pole Double Throw) switch

Anvone who wants the switch fitted but has little experience of soldering should get someone who is capable to do it for them,

Thunks for the tip, it is pretty obvious when you think about it, the only drawback is that the warranty will be invalidated - but this is usually not too great a problem.

The four corner pins on the YM2149 ewitch should be wired as shown, corner to corner Fine 19 & 20 eselte's

19-25 HOVEMBER 1987

On the latch

Kenn Garroch continues, in the second part of his series on interfacing, to deal with aspects of decoding on the Z80.

ast week. I looked at the two basic input output (1/6) systems to use on home microcomputers, the 8592 and 280 types. This week I'll look at how to decode the address and data buses on the 280 (8080 etc) to bring it up to a similar state as systems using w.l.m. chips.

There are six main signals that have to be decoded to specify an 1/o access, the address box which tells the hardware which part to use, the data bus where the information is read in or written out, the read and write lines which define the byte of data on it is, physically setting the 8 lines to different states in not allowed as it would interfere with the rest of the system.

To get around this a system known as Tri-State is used for any signals to be placed on the bus. All chips designed to be interfaced directly to a data bus have tristate outputs, and when they are in tristate mode, are effectively invisible to the data bus as though they were physically switched off, not set high or low. tant. Since the data is only available on the microprocessor's bus at the time it is written, the 8218 needs to store it so that any external circuitry can read it at any time.

Latches

For instance, when using the computer m control a set of lights (up to 8 Light Emitting Diodes or LEDS), each data line on the bus defines one of them. Setting bit II to 1 (8V) turns the light on, and setting it w zero (8V) turns it of 1.

we zero (VY) turns it off.
Since the data but is line; resident and
writing memory, reading the keybours, dissimply attending the light to one of its bits
will cause it to finsh. To sustain the output
sear with the OUT command, the byte that
will cause it to finsh. To sustain the output
on the sustain the control of the bits
in the 8321 until it is changed by the
computer. The latches perform this function. Each of the C inputs is a clock that
takes the state of D and passes is along to Q
size to the batches can be cleared with a
pulse on R.

Device select

There are two device select lines, DS1 and DS2 and to disable the tri-state, DS1 is set continued im page 28 >

direction and the memory and lorg selects to separate memory from 10. When an input or output instruction is come across by the processor the port number is placed on the data bus, the memory request is sent highle, decelect, the 10 request is set low and for an in, the read is set low and write high. For a write, the read and write signals are swapped and the data bus has the data to be written placed on.

Simple logic

Some simple logic is needed to decode all of these signals into a single signal that foils the external hardware to become active. Because the data bus is constantly in use for memory access, simply placing a

input, the tri-state can be disabled (also known as chip/device select) allowing the processor to read the information placed on the data bus.

Decoding

The logic circuit shown in Fig. 1 is one way of decoding the various signals to give a signal that is used III disable; the tri-state when the interoprocess is ready. To form a simple read/write port, the 8212 chip (Figs 2 and 3) can be used. This is simply an octal (8) lines buffer that has tri-state and fatching capabilities. It can be used for either input or output depending on how II is wired up. When It is used as an output rule reading facility becomes import, the latching facility becomes import, the latching facility becomes impor-

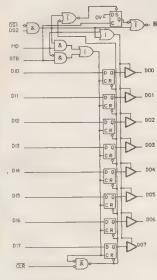

Fig 3 - 8212 internal logic

low, and DS2 high. For an output, they will always be in this position for an input (to the processor), they are only set when

needed.

The advantage of having two select lines is that either a high select or low select can be used simply by setting the other line to

its active state.

The circuit in Fig 1 can be used to make the 8212 into an input port by taking the output of the last AND gate ic, select, and using it to control DS2. DS1 is attached to 0V so that the output from the chip is placed on the data bus when DS2 goes high. At other times it is in tri-state mode.

Inputs

The inputs to the 8212 work according to the table in Fig 4, SEL is used to denote the DS lines in selected state le. DS1=0 & DS2=1 is SEL=1 and any other state is SEL=0.

There are other lines on the 8212 and examination of Fig 3 in conjunction with the truth tables shown last week should show the functions.

Forming the 8212 into an output port is a little more complicated as the data placed on the data bus with the OUT command must be latched so that it is available when the processor goes off to do other things. The logic circuit in Fig. 1 is changed so

that write (WR) is used instead of read, MD is set to 0 and the select from the logic goes to STB. As can be seen from the table in Fig. 4. I armsition of STB from 1 to 0 sets the output of the chip from straight through to latched data.

So, when port 8d is selected with the output.

command STB goes high and the data on the data bus goes straight through.

After the command, STB goes low, and the data is latched so that it appears at the cursors until more is sent out. Obviously, the 8212 is changed around so that the DI lines come from the data bus, and the DO lines are the output.

Some simple logic is needed to decode all of these signals into a single signal that foils the external hardware to become active . . . the logic circuit is one way of decoding that.⁷⁹

STB	MD	SEL	Data out is:
0	0	0	Tri-state
1	0	0	Tri-state
0	1	0	Data latch
1	1	0	Data latch
	0	1 1	Data latch
1	0	1	Data in
0	1	1	Data in
1	1	1	Data in

unseen by processor data bus

This is data that was latched in

Data input straight through to output

Spectrum Various

J Collins

The following routines were sent in as a series by J Collins of London. They all use the same loader and so you will have minclude lines 10-50 of the first one with them all.

The first is Music which allows dual channel sound to be played. The syntax is:

INPUT USR \$0000.duration,note 1.note 2.
Where the duration varies from 0-255. The routine starts at 60000 and is 45 bytes long. The loader is included in this listing to show how it works.

The second routine $\mathbb R$ Bases and is used to convert and print declinal numbers into the bases of 16 (hexadecimal), 2 (kinary), and 8 (cotal), To convert the 8 hit number (0-285) in one of these bases, use RANDOMISE a where in the number to print the number use LET xx=USR 0460Y the last digit (Y) depends on which thas you want, Y=0 is hexadecimal, Y=0 for routin, and Y=0 for routin Y=0 in the subsetting of the first of t

from the Music listing for the toader.

The third routine is Pade and is used to fade out any graphics on screen. The utility is called

The fourth utility (PONES) allows strings to be paked into memory. The syntax for the routine is INPUT USR 61700.addr.string where addr is where the string will start and the string is a normal string ie, "This is OK" or p\$ or

p8(2 TO 4) etc.
Finally, Passurd also involves string but this
time in the guise of a password system that
locks the Spectrum up until the correct password is entered. The systax is: INPLY USB
61000,patcs where pass is any form of string as
described for POKES. Short of turning the
computer off, there is no way.

PECTRUM REPAIRS

An honest 6 month guarantee. We repair any fault within 6 months, you do not have to prove that the same fault has reoccurred as with other companies. Full overhaul and up-date with each repair to identify and repair all fauls ensuring continuing

reliability. Over 17 years computer maintenance experience on all types of systems from main frames to micro's. Probably ten years more than our nearest competitor.

Fast efficient service. Most units are despatched fully insured by first classs post within 24 hours of No "free" games tape - we could offer you £50 worth of games with each repair, but instead we use

BBC, Commodore, Amstrad. Free estimates. Normal repair costs £25.00.

Educational Authority orders welcome.

We also service a wide range of peripherals, including disc drives and printers.

What are we playing at?

"s this just a game or is it real?" asks the boy at the keyboard "What's the difference?" answers

the voice synthesises of the contract of the c

Instead, maybe our hero should have got stuck into High Frontier the Strategic Defence Initiative simulation from Activision. At least then he would have known that any harm he could wreak would stop at his monitor - or in the realms of his imagination. Just good clean fun.

No room here for informed discussion, questioning the practicalities and desirability of SDI in the world arena. High Frontier's promo blurb makes sure you know whose side you're on right from the start: "4,000 Soviet nuclear warheads are targeted at the North American mainland . . . You are the project leader committing staff and funds to make SDI a reality. You must make the decisions that could save the American mainland . . . " Oh good. Because, let's face it, if the whole world were teetering on the edge of oblivion we'd all want to be reassured that the good ol' U.S. of A. was going to be ok. Sod the rest, and especially those Ruskies with their awful 'Evil Empire'.

Activision are by no means alone in their very definite approach to who the

good guys are. A number of battle simulation games do away with the nicoties of any pretence of attempting for remain apolitical. Why waste time and trouble inventing imaginary enemies when we all know what the public want? Micro Prose? PIS Strike Eaple provides us with all the hi-tech weaponry we need to blast those masy MiG fighters, and to cheerfully bomb Egyst, Lybia, Haiphong, Hanol, the Persian Guif, Iraq, or Syria. Gung ho ho ho!

Are these games too warlike - too violent? Is this what I'm driving at? No. SDI at least involves, as far as I can gather, shooting down missiles, not people; and any war game or battle simulation will inevitably involve a degree of sanitised violence, as will any kind of fictional adventure from Hansel and Gretel to Raiders of the Lost Ark. What is worrying here is not so cut and dried as the antiviolence lobby would probably see it. I am certainly less concerned than the German government seem to be about the odd decapitation in fantasy games such as Palace Software's Barbarian, which they have just banned. I personally don't believe that the graphics in such a game could possibly produce images of violence so realistic as to cause offence, or that violence itself in a game necessarily incites violent behaviour.

Pantasy as a fictional genre is generally regarded as useful because it allows great moral questions to be pondered in symbolic form. A great deal of hack and slay a zapping with futuristic weapons goes on in the tussle between the forces of light and darkness. Look at Tolkien as a prime example, or Dr. Who! The problem I games, but rather the values and rationale which underpin the action. High Frontier and Strike Eagle have more worrying qualities than the more overtly 'shocking' Barbarian.

They are set very firmly in the real world, and they propose a definite set of political preconceptions for gameplay, which qualify the action whilst inadvertently reinforcing an insidious and reactionary 'us and them' mentality.

Though I have said that I dispute that the portrayal of violence in games in itself incites violent behaviour, I can see a problem where violence in portray against a realistic backfory, and is series anothing short of desirable. Where the violence becomes the main focus of the game and is merely gratultous.

The software companies know how inportant the scenario is. How else do you explain the inclusion of a 48 page novella in Firebird's classic Edite? Outside the simple mase or platform format, computer games are after all role play. And the more satisfying the securatio, the more satisfying the playing of the role. But what values are we willing to take on board in the process—

or to compromise?

The software companies should realise this, and take careful responsibility in future games design concepts.

With echoes of War Games, the High Frontier prome concludes that it's "...hopefully as near as you'll ever get to the real thing ... or is it?"

"Is this just a game or is it real?" The action is just a game, but what's underneath the action - and what does playing it say about me?
